

## Decimal Number System

The number system that we use in our day-to-day life is the decimal number system. Decimal number system has base 10 as it uses 10 digits from 0 to 9. In decimal number system, the successive positions to the left of the decimal point represent units, tens, hundreds, thousands, and so on.

Each position represents a specific power of the base (10). For example, the decimal number 1234 consists of the digit 4 in the units position, 3 in the tens position, 2 in the hundreds position, and 1 in the thousands position. Its value can be written as

$$\begin{aligned} &(1 \times 1000) + (2 \times 100) + (3 \times 10) + (4 \times 1) \\ &(1 \times 10^3) + (2 \times 10^2) + (3 \times 10^1) + (4 \times 10^0) \\ &1000 + 200 + 30 + 4 \\ &1234 \end{aligned}$$

## Binary Number System

Characteristics of the binary number system are as follows –

- Uses two digits, 0 and 1
- Also called as base 2 number system
- Each position in a binary number represents a **0** power of the base (2). Example  $2^0$
- Last position in a binary number represents a **x** power of the base (2). Example  $2^x$  where **x** represents the last position - 1.

Step	Binary Number	Decimal Number
Step 1	10101 <sub>2</sub>	$((1 \times 2^4) + (0 \times 2^3) + (1 \times 2^2) + (0 \times 2^1) + (1 \times 2^0))_{10}$
Step 2	10101 <sub>2</sub>	$(16 + 0 + 4 + 0 + 1)_{10}$
Step 3	10101 <sub>2</sub>	21 <sub>10</sub>

**Note** – 10101<sub>2</sub> is normally written as 10101.

## Octal Number System

Characteristics of the octal number system are as follows –

- Uses eight digits, 0,1,2,3,4,5,6,7
- Also called as base 8 number system

- Each position in an octal number represents a **0** power of the base (8). Example  $8^0$
- Last position in an octal number represents a **x** power of the base (8). Example  $8^x$  where **x** represents the last position - 1

### Example

Octal Number:  $12570_8$

Calculating Decimal Equivalent –

Step	Octal Number	Decimal Number
Step 1	$12570_8$	$((1 \times 8^4) + (2 \times 8^3) + (5 \times 8^2) + (7 \times 8^1) + (0 \times 8^0))_{10}$
Step 2	$12570_8$	$(4096 + 1024 + 320 + 56 + 0)_{10}$
Step 3	$12570_8$	$5496_{10}$

**Note** –  $12570_8$  is normally written as 12570.

## Hexadecimal Number System

Characteristics of hexadecimal number system are as follows –

- Uses 10 digits and 6 letters, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
- Letters represent the numbers starting from 10. A = 10, B = 11, C = 12, D = 13, E = 14, F = 15
- Also called as base 16 number system
- Each position in a hexadecimal number represents a **0** power of the base (16). Example,  $16^0$
- Last position in a hexadecimal number represents a **x** power of the base (16). Example  $16^x$  where **x** represents the last position - 1

### Example

Hexadecimal Number:  $19FDE_{16}$

Calculating Decimal Equivalent –

Step	Binary Number	Decimal Number
------	---------------	----------------

Step 1	$19FDE_{16}$	$((1 \times 16^4) + (9 \times 16^3) + (F \times 16^2) + (D \times 16^1) + (E \times 16^0))_{10}$
Step 2	$19FDE_{16}$	$((1 \times 16^4) + (9 \times 16^3) + (15 \times 16^2) + (13 \times 16^1) + (14 \times 16^0))_{10}$
Step 3	$19FDE_{16}$	$(65536 + 36864 + 3840 + 208 + 14)_{10}$
Step 4	$19FDE_{16}$	$106462_{10}$

**Note** –  $19FDE_{16}$  is normally written as 19FDE.
